

Lucky Boba POS

Cashier User Guide & Operating Manual

Complete reference for terminal operations and shift management

Welcome to the **Lucky Boba POS Cashier Portal**! As a Cashier, you are the face of Lucky Boba operations. Your role involves starting the terminal register, processing customer orders, tracking sales receipts, monitoring raw material counts, and reconciling the cash drawer at the end of your shift. This guide details every single sidebar tab, structured in their exact visual sequence, along with step-by-step instructions and operational rules.

Sidebar Navigation Tip (Accordion Folders)

Several navigation options in the sidebar are organized into collapsible dropdown folders (accordions). If you cannot see a specific tab, click the parent folder row to expand it:

- Point of Sale (Cash In, Cash Drop, Menu, Online Orders, Search Receipts, Cash Count EOD)
- Sales Report (Dashboard, Items Report, X Reading, Z Reading)
- Menu Items (Menu List, Category List, Sub-Category List)
- Inventory (Dashboard, Raw Materials, Usage Report, Recipes, Stock Transfer)

Section A: Dashboard Group

A1. Central Dashboard Tab

Purpose: Live terminal performance summary panel displaying cashier shift totals and network status indicators.

Key Operations:

- Review your total net sales, transactions processed, and payment methods (Cash vs GCash/Maya) for today's active shift.
- Monitor terminal connection health and synchronization queue statuses.

Section B: Point of Sale Accordion Group

B1. Cash In Tab

Purpose: Start your cashier shift and register the opening cash drawer float.

Step-by-Step Instructions:

1. Click the **Point of Sale** accordion to expand it, and select **Cash In**.
2. Physically count the starting cash coins and bills in your drawer.
3. Input the exact **Opening Cash Float** amount (e.g., ₱2,000.00) in the input field.
4. Click **Submit Cash In** to register.

How Shifts Are Assigned (AM vs PM):

- **AM Shift:** The first cashier to log in and perform a Cash In for the business day is automatically designated as the AM Shift cashier. The system records their name, cash-in time, and opening float against the AM shift slot.
- **PM Shift:** After the AM cashier completes their Cash Count EOD and closes their shift, the terminal is released. The next cashier to log in and perform a Cash In will automatically become the PM Shift cashier.

Shift-Specific Login Rule

Once you have cashed in and your shift is active, no other user should log in to this terminal device for the entire duration of your shift. Logging in a different user account while your shift is running will corrupt your shift records — including sales receipts, drawer totals, and cash count accuracy. Only allow a new user to log in after you have completed your Cash Count EOD and fully closed your shift.

Terminal Cash-In Lock

The Menu ordering interface remains completely locked until Cash In is successfully completed. Attempting to click "Menu" before cashing in will trigger a "Menu Locked" popup directing you to start your shift.

B2. Cash Drop Tab

Purpose: Transfer excess drawer cash to the back-office vault during an active shift to prevent drawer theft risks.

Step-by-Step Instructions:

1. Open the **Cash Drop** tab.
2. Input the exact amount of cash you are skimming out of the drawer.
3. Click **Perform Cash Drop**.
4. Hand the physical cash immediately to your branch manager to audit and store in the safe.

B3. Menu Tab

Purpose: Processing local customer walk-in orders.

Step-by-Step Instructions:

1. Open the **Menu** tab (navigates to the full-screen order grid).
2. Select the drink (e.g. Okinawa Milk Tea).
3. Select cup size (Medium, Large) and modifiers:
 - **Sugar levels:** 0%, 25%, 50%, 75%, 100%.
 - **Ice levels:** No Ice, Easy Ice, Normal Ice.
 - **Add-ons:** Tapioca Pearls, Nata de Coco, Pudding.
1. Choose order type: Dine-in, Takeaway, or Delivery.
2. Select payment: Cash, GCash, Maya, or Loyalty Card. Input customer amount, calculate change, and click **Process Order** to print receipts.

PIN Override Rule

Cashiers cannot delete printed tickets, void active items, or apply special manual discounts. These actions require a supervisor or manager to enter their secure 6-digit manager PIN directly onto the screen to override cashier limits.

B4. Online Orders Tab

Purpose: Live tracking of online orders.

How it works: Real-time dashboard panel showing web and customer app orders. Mark orders as complete to update front-facing pickup screens.

B5. Search Receipts Tab

Purpose: Locate, reprint, and review receipt details.

Key Operations:

- Search receipts by SI number, customer name, date range, or status.
- **Reprint:** Click reprint to generate customer receipts, kitchen slips, or label stickers.
- **Void:** If a transaction must be voided, select the receipt, click **Void Request**, input the reason, and request your supervisor to input their 6-digit PIN override.

B6. Cash Count EOD Tab

Purpose: Reconciling cash drawer totals at shift EOD closure.

Step-by-Step Instructions:

1. Open the **Cash Count EOD** tab.
2. Physically count every bill and coin left in your cash register.
3. Enter the cash totals in the declaration grid.
4. The system calculates register discrepancy counts: $\text{Drawer Discrepancy} = \text{Declared Cash} - \text{System Expected Cash}$
5. Click **Submit Cash Count** to finalize shift drawer reconciliations.

Shift Handover After EOD

Once you successfully submit your Cash Count EOD, your shift is officially closed. The terminal is now released and available for the next cashier (PM Shift) to log in and perform their own Cash In. Make sure you have completely finished serving all customers before submitting your EOD — you will no longer be able to process new orders after this step.

Section C: Sales Report Accordion Group

C1. Sales Dashboard Tab

Purpose: High-level view of sales transaction trends.

Key Operations: Review hourly sales charts, transaction count spikes, and top-selling flavors.

C2. Items Report Tab

Purpose: Catalog sales tracker.

Key Operations: View lists of items sold at your station. Features sorting configurations and CSV export options.

C3. X Reading Tab

Purpose: Mid-shift drawer status check.

Key Operations: Snapshot summary of shift transactions without closing the register. Shows gross revenue, VAT, cash counts, GCash/Maya amounts, and discounts. Expected cash drawer totals are calculated:

Expected Drawer Cash = Cash Float + Cash Sales – Cash Drops

C4. Z Reading Tab

Purpose: Reconciled Daily Closure — permanent printed summary of the entire shift.

Z-Reading Dependency

Accessing the Z-Reading tab is completely blocked until the Cash Count EOD has been completed and submitted. Once Z-Reading is generated, the terminal register locks permanently for new orders until the next shift is initialized.

AM → PM Shift Handover Sequence:

1. **AM Cashier** → Cash In → Process Orders → Cash Drop (if needed) → Cash Count EOD → Z-Reading Generated 
2. **PM Cashier** → Log In → Cash In → Process Orders → Cash Drop (if needed) → Cash Count EOD → Z-Reading Generated 

PM Cashier Prerequisite

The PM cashier cannot start their Cash In until the AM cashier has completed their Cash Count EOD. Never skip steps or attempt to cash in while a previous shift is still open.

Section D: Menu Items Accordion Group

D1. Menu List Tab

Purpose: View-only access to product pricing catalog lists.

Key Operations: Check size pricing levels and modifier add-on costs to verify order totals.

D2. Category List Tab

Purpose: View category classifications.

D3. Sub-Category List Tab

Purpose: View nested subcategory taxonomies.

Section E: Inventory Accordion Group

E1. Inventory Dashboard Tab

Purpose: Branch ingredient stock overview.

Key Operations: View low stock raw material alerts and review stock take dates.

E2. Raw Materials Tab

Purpose: Monitoring ingredient levels.

Key Operations: Displays raw ingredients, stock quantities, and physical measurement units (Grams, Pieces, Milliliters).

E3. Usage Report Tab

Purpose: Consumption variance audits and spillage tracking.

How it works: Compares expected ingredient consumption (theoretical usage from recipe mappings multiplied by POS sales counts) against manual warehouse stocktake levels (Ending Stock).

End-to-End Example: Okinawa Milk Tea (Large)

Recipe Linkage: A large cup requires 50g Okinawa Powder (₱0.20/g) and 30g Tapioca Pearls (₱0.10/g).

Theoretical Depletion: If the branch sells 100 cups of Okinawa Milk Tea (Large) in a week:

- Okinawa Powder expected depletion: $100 \times 50\text{g} = 5,000\text{g}$
- Tapioca Pearls expected depletion: $100 \times 30\text{g} = 3,000\text{g}$

Inventory Reconciliation Table:

Raw Material	Starting Stock	Received	Expected End	Actual Physical Count	Variance	Discrepancy Cost	Action Required / Conclusion
Okinawa Powder	10,000g	0g	5,000g	4,800g	-200g	-₱40.00	Negative Variance: Powder spillage or over-portioning occurred.

Tapioca Pearls	5,000g	0g	2,000g	2,000g	0g	₱0.00	Balanced: Portioning scoop size is accurate.
----------------	--------	----	--------	--------	----	-------	---

E4. Recipes Tab

Purpose: View-only access to recipe raw material portion metrics.

Key Operations: Review exact ingredient ratios (e.g. 50g Okinawa Powder) to verify accurate cup portioning.

E5. Stock Transfer Tab

Purpose: Accept stock transfers from neighboring branches.

Key Operations: Check incoming ingredient shipments, count received boxes, and click **Accept Transfer** to increase branch inventory balances.

Section F: Settings and Maintenance Group

F1. Settings Tab

Purpose: Local terminal settings preferences.

Key Operations: Manage system default timezone, active printers, and terminal receipt customization metadata.

F2. Settings Secondary Sub-menus

From the settings panel, cashiers can access the following secondary options:

- **Sales Settings / Discount Settings:** View terminal discount rules and payment settings parameters.
- **Backup System:** Back up localized terminal cash logs to a local disk drive.
- **Export Data / Upload Data:** Local data imports/exports.
