

Lucky Boba POS

Supervisor User Guide & Operating Manual

Complete reference for floor-level operations and shift management

Welcome to the **Lucky Boba POS Supervisor Portal**! As a Supervisor, you are the operational authority on the floor. You have the power to authorize void overrides at the POS terminal, monitor and audit all branch transactions, manage expenses, oversee inventory levels, review shift readings, and maintain product catalog visibility. This guide details every single sidebar tab, structured in their exact visual sequence, with step-by-step instructions and key operational rules.

Sidebar Navigation Tip (Accordion Folders)

Several navigation options in the sidebar are organized into collapsible dropdown folders (accordions). If you cannot see a specific tab, click the parent folder row to expand it:

- Inventory (Stock Levels, Item Checker, Raw Materials, Stock Transfer, Recipes)
- Reports (Sales Analytics, Items Report, Usage Report, X-Reading, Z-Reading)
- Product Menu (Menu Items, Categories, Sub-Categories)

Section A: Home Group

A1. Dashboard Tab

Purpose: Live branch performance summary for the Supervisor's current shift context.

Key Operations:

- Review today's total net sales, transaction count, and active payment method breakdown (Cash vs GCash/Maya).
- Monitor which cashier shift is currently active (AM or PM).
- Check terminal synchronization and connectivity health.
- Identify if any void events or cash drops have occurred this shift.

A2. Staff Overview Tab

Purpose: Branch staff user directory and live shift activity monitor.

Key Operations:

- View all branch staff accounts with their assigned roles (Cashier, Team Leader, Supervisor).
- Monitor currently logged-in users and their active terminal status.
- Review shift assignment records — who cashed in, under which shift slot (AM or PM), and at what time.
- Flag staff accounts to the Branch Manager if login anomalies are detected.

Section B: Floor Ops Group

B1. Void Journal Tab

Purpose: Authorization hub for transaction voids and audit trail viewer.

Supervisor Void PIN Role:

 Supervisors are the gatekeepers of all POS voids

When a cashier initiates a void on the POS terminal (for a miskeyed order, wrong item, or customer cancellation), the terminal will prompt for a Supervisor 6-digit PIN override. The Supervisor must physically walk to the terminal and enter their PIN to authorize the void. This prevents unauthorized cancellations and protects revenue integrity.

Void Journal Audit View:

Review a chronological log of all void events for the day, including:

Field	Description
SI Number	Receipt reference of the voided transaction
Cashier Name	Who processed the original order
Void Authorized By	Supervisor name whose PIN was used
Void Reason	Reason entered at the time of the void
Void Timestamp	Exact date and time the void was applied
Amount Voided	Total peso value cancelled

Identifying Suspicious Void Patterns:

- High void frequency from a single cashier in a short time window.
- Voids consistently occurring near shift end.
- Large-value voids without clear reason notes.
- Report any flagged patterns immediately to the Branch Manager.

B2. Expenses Tab

Purpose: Log and track branch operating expenses (OPEX) against the daily revenue record.

Step-by-Step Instructions:

1. Open the **Expenses** tab.
2. Click **Add New Expense**.
3. Select the expense category (e.g., Utilities, Supplies, Maintenance, Transportation).
4. Enter the amount, payment date, and a clear description.
5. Upload a photo of the official receipt or proof of payment.
6. Click **Save Expense** to post it to the branch's expense ledger.

Accounting Role: Branch expenses are factored into net profitability calculations:

Net Profit = Gross Sales – COGS – OPEX (Expenses)

 Receipt Requirement

Always attach a valid official receipt image when logging an expense. Expenses without proof of payment may be flagged and rejected during Branch Manager or Superadmin review.

Section C: Inventory Accordion Group

C1. Stock Levels Tab

Purpose: Consolidated branch inventory overview — current stock status of all raw materials.

Key Operations:

- View the current stock quantity for every ingredient in the branch, with measurement units (Grams, Milliliters, Pieces).
- Filter by low-stock threshold alerts to identify items that need replenishment.
- Review last stocktake date to assess data freshness.

C2. Item Checker Tab

Purpose: Quick menu item feasibility check — verify if a product can currently be prepared given available stock.

Key Operations:

- Search for any menu item by name.
- The system cross-references its recipe ingredient requirements against current raw material stock levels.
- Displays a clear  (can prepare) or  (insufficient stock) status per ingredient.
- Use this before a rush period to proactively identify items that should be 86'd (temporarily removed from the menu).

C3. Raw Materials Tab

Purpose: Detailed ingredient registry — individual stock quantities and unit costs.

Key Operations:

- View the full list of raw materials, their current stock quantities, and cost per unit.
- Identify ingredients approaching depletion.
- Cross-reference with the Usage Report to detect over-consumption patterns.

C4. Stock Transfer Tab

Purpose: Receive ingredient stock shipments sent from other branches or the main warehouse.

Key Operations:

1. Check the **Incoming Transfers** queue for pending shipments.
2. Physically count the received items and verify quantities match the transfer manifest.
3. Click **Accept Transfer** to credit the received quantities to the branch's raw material balances.

● **Verify Before Accepting**

Always physically verify item counts before clicking Accept. Once accepted, the stock transfer is posted to inventory and cannot be reversed without a Branch Manager override.

C5. Recipes Tab

Purpose: View-only reference of all product ingredient compositions and portioning specifications.

Key Operations:

- Review exact ingredient quantities required per menu item (e.g., 50g Okinawa Powder per large cup).
- Use as a reference when coaching cashiers or baristas on correct portioning.
- Cross-reference with the Usage Report when investigating ingredient variance.

Section D: Reports Accordion Group

D1. Sales Analytics Tab

Purpose: High-level branch sales performance dashboard.

Key Operations:

- Review hourly and daily gross sales trends.
- Monitor transaction volume spikes and payment method distributions.
- Compare Cash vs GCash/Maya revenue ratios.
- Filter by date range for shift-specific or weekly analysis.

D2. Items Report Tab

Purpose: Per-item sales tracker and product performance ranking.

Key Operations:

- View a ranked list of menu items by quantity sold and total revenue generated.
- Identify top-selling and slow-moving products.
- Use this to inform daily prep quantities and manage waste.
- Export data as CSV for Branch Manager reporting.

D3. Usage Report Tab (Variance & Spillage Tracking)

Purpose: Consumption variance audit — compares theoretical ingredient depletion (recipe × sales) against physical stocktake readings.

Key Operations:

- Select a date range and generate the report.
- The system calculates: $\text{Variance} = \text{Theoretical Usage} - \text{Actual Physical Usage}$
- **Negative variance** = over-consumption (spillage, waste, or over-portioning).
- **Positive variance** = under-consumption (potential stocktake inaccuracy or theft).

Example: Okinawa Milk Tea (Large) — Weekly Reconciliation

Raw Material	Starting Stock	Received	Expected End	Actual Physical Count	Variance	Discrepancy Cost	Conclusion
Okinawa Powder	10,000g	0g	5,000g	4,800g	-200g	-₱40.00	Spillage or over-portioning detected
Tapioca Pearls	5,000g	0g	2,000g	2,000g	0g	₱0.00	Perfectly balanced portioning

D4. X-Reading Tab (Mid-Shift Snapshot)

Purpose: Mid-shift register snapshot — check real-time drawer status without closing the register.

Key Operations:

- Review running transaction count, expected cash in drawer, e-wallet totals, VAT breakdown, and discounts applied so far in the active shift.
- Expected cash formula: $\text{Expected Drawer Cash} = \text{Cash Float} + \text{Cash Sales} - \text{Cash Drops}$
- Does not lock or close the register — the cashier continues processing orders after X-Reading is generated.
- Use this for unannounced mid-shift supervisory spot checks.

D5. Z-Reading Tab (EOD Closure & AM/PM Shift Rules)

Purpose: End-of-Day (EOD) permanent closure report — locks the register and finalizes daily shift totals.

Key Operations:

1. Select the target shift slot (**AM Shift** or **PM Shift**).
2. Review the **Declared Cash** (physically counted by the cashier) against the **System Expected Cash**.
3. Confirm closure and click **Generate Z-Reading** to permanently lock that shift's register.

How Shifts Are Assigned (AM vs PM):

- **AM Shift:** The first cashier who logs in and performs a Cash In for the business day is automatically designated as the AM Shift cashier. The system records their username, cash-in time, and opening float against the AM shift slot.
- **PM Shift:** After the AM cashier completes their Cash Count EOD and closes their shift, the terminal is released. The next cashier who logs in and performs a Cash In will automatically become the PM Shift cashier.

Cashier Login Security Rule

Once a cashier has cashed in and their shift is active, do not allow any other user account to log in to that same terminal device for the entire duration of that shift. Logging in a different user mid-shift will corrupt the active cashier's shift metrics, receipt ownership records, and drawer expected cash calculations. Only allow a new user to log in after the active cashier has completed their Cash Count EOD and fully closed their shift.

Full Daily AM → PM Handover Sequence:

1. **AM Cashier** → Cash In → Process Orders → Cash Drop (if needed) → Cash Count EOD → Z-Reading Generated 
2. **PM Cashier** → Log In → Cash In → Process Orders → Cash Drop (if needed) → Cash Count EOD → Z-Reading Generated 

PM Cashier Prerequisite

The PM cashier cannot start their Cash In until the AM cashier has fully completed their Cash Count EOD. As Supervisor, it is your responsibility to ensure the AM shift is properly closed before allowing the PM cashier to proceed.

Z-Reading Access Constraint

The Z-Reading tab is completely blocked until the Cash Count EOD has been completed and submitted by the cashier. Once generated, the register locks permanently for new orders until the next business day's shift is initialized.

Section E: Product Menu Accordion Group

E1. Menu Items Tab

Purpose: View-only access to the full product catalog — all menu items, sizes, and pricing.

Key Operations:

- Review product details, size tiers (Medium/Large), modifier options (sugar, ice, add-ons), and prices.
- **Combo:** A pairing of exactly 1 food item and 1 drink (e.g., Classic Milk Tea + Croffle).
- **Bundle:** A drinks-only package (e.g., 2 Drinks Deal).
- Use as a reference when verifying cashier order accuracy or resolving customer pricing disputes.

E2. Categories Tab

Purpose: View-only classification of product main categories (e.g., Classic Series, Snacks).

Key Operations:

- Review category display order on the POS ordering grid.
- Verify active/inactive status for seasonal or promotional categories.

E3. Sub-Categories Tab

Purpose: View-only classification of nested subcategories mapped under main categories.

Key Operations:

- Inspect subcategory structures to verify correct product groupings.
- Cross-reference with the Menu Items tab for category assignment accuracy.

 Supervisor Quick Reference: Daily Shift Rules

Rule	Description
AM Shift Assignment	First Cash-In of the business day = AM Shift cashier
PM Shift Assignment	First Cash-In after AM Cash Count EOD = PM Shift cashier
Login Security	No other user may log in while a cashier shift is active
PM Prerequisite	PM cashier cannot Cash In until AM cashier completes EOD
Z-Reading Lock	Cash Count EOD must be submitted before Z-Reading is accessible
Void Authorization	All POS voids require Supervisor 6-digit PIN override
Expense Receipts	All logged expenses must have an attached official receipt image
